MUSEDOTS RFQ AGENT

Autonomous industrial bidding

An AI agent that investigates four business websites and submits a reviewed, TAN-signed bid.

6th place · 100/100 quality

Top-seven selection for the finale pitch meeting
Complete agent implementation by Bilal Amin · Team musedots

One bid, four sources of truth

Each website holds a different part of the decision.

Tender portal	Positions, quantities, clarifications, bid form
Supplier portal	Technical specification and document revisions
Company ERP	Materials, stock, lead times, price conditions
Webmail	Authorized terms, approvals, and signing TAN

The challenge: reconcile current evidence before committing a bid.

Evidence to signed bid

01 **Investigate**

Read requirements, revisions, quantities, and approvals.

02 **Match & calculate**

Select materials; compute prices, charges, and delivery.

03 **Validate & review**

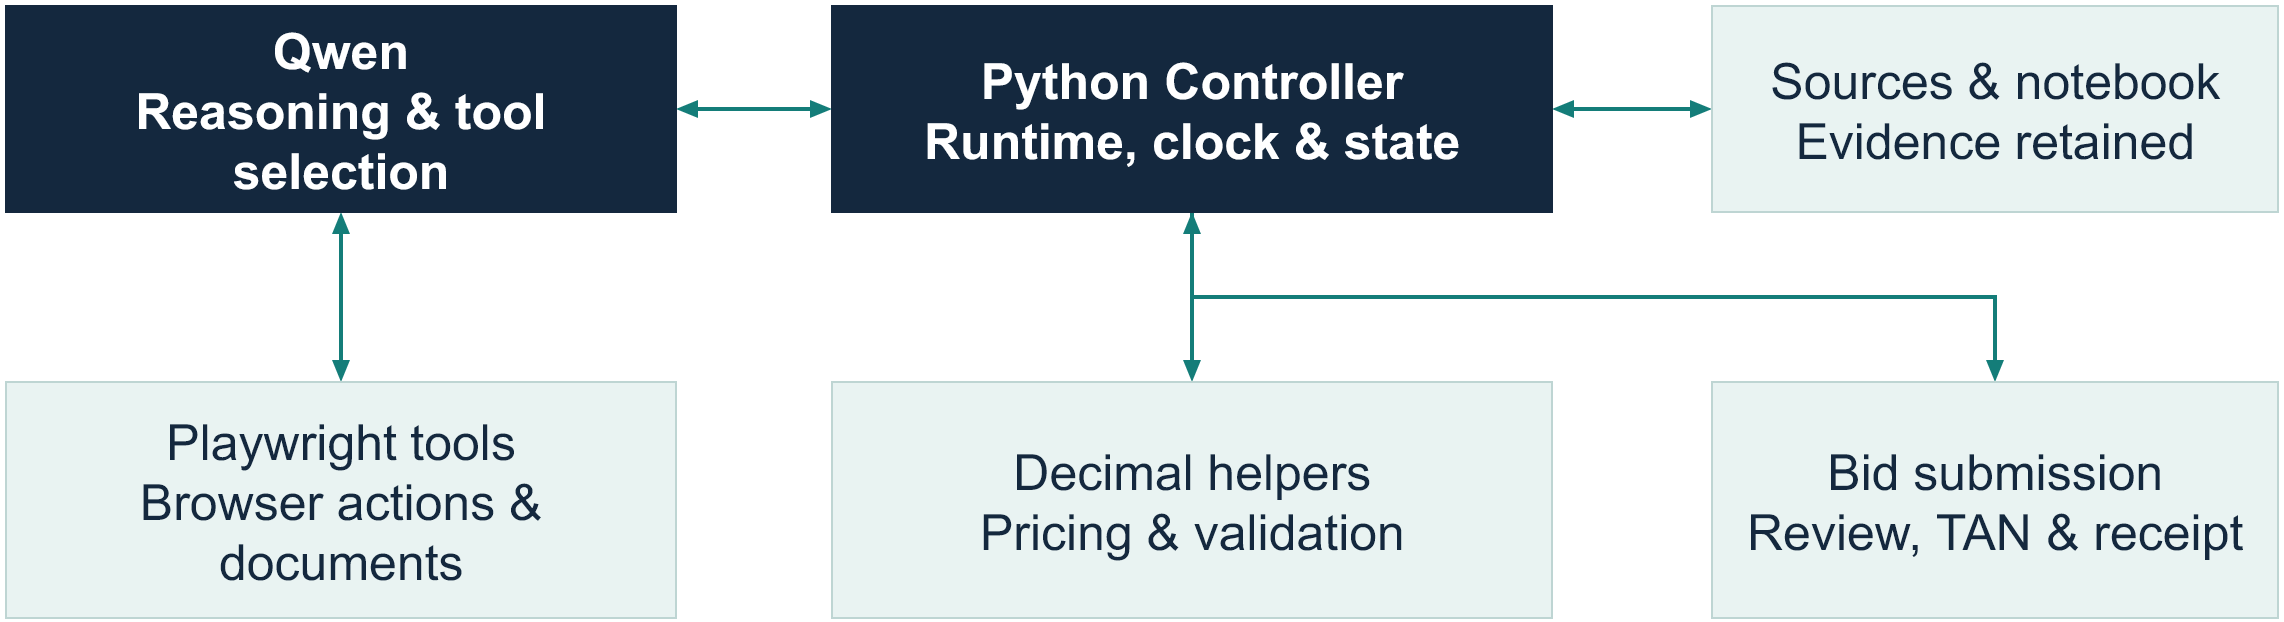

Check evidence and formulas; compare the displayed bid.

04 **Sign & confirm**

Retrieve the TAN, sign, and verify the accepted receipt.

One controller, a model-directed tool loop

Qwen chooses the next action; Python executes and checks it.

Four browser sessions requested; one controlling model loop.
Tools and captured evidence feed back into the next model decision.

Checks before the final click

Evidence	Candidate fields require captured sources and formulas.
Arithmetic	Decimal helpers calculate prices and verify the total.
Review	Displayed portal values must match the validated bid.
Completion	Signing is gated; an accepted receipt is checked.

Bounded retries and a submission reserve help manage the deadline.

A complete implementation, a measured result
